

How developers deal with “off mains” foul waste has become a bigger priority for them in more recent years, quality developers look for a more sustainable waste water treatment solution having recognised the benefit to their sales and marketing. Sewage receives far more media attention on account of a nationally aging infrastructure plus the drive by Natural England to reduce nutrient inputs has put waste water in the forefront for local planning authorities and development design, resulting in developers looking at the overall value of providing a better solution for the environment rather than doing the bare minimum.

Metis Homes chose a Bio-Bubble for their Meon Valley development of ten contemporary style homes, which makes sense when having a reputation as being a premium high-quality developer. Bio-Bubble was a good fit with its quality along with the added benefit of reducing the site’s nutrient budget. Metis Homes will be able to hand over the Bio-Bubble waste water treatment plant to the estates management company secure in the knowledge that the ongoing service and maintenance is well provided for within the management plan and the plants Service Level Agreement.

Real time remote monitoring via a broad band link provides us with the management information required to ensure that the operation of the treatment plant is within its design parameters, plant status notifications, flow reports and alarm notifications are emailed out to those who wish or need to receive them, this close attention means that Estate management companies can demonstrate due diligence is undertaken to be confident the operation of the system is as designed and that LPA’s can be reassured that systems can perform year on year when well maintained.

Reports and data can be saved electronically ready to be provided to The Environment Agency as and when it might be required.
